Google Workspace

# Security advisor in Google Workspace

Personalized insights, threat protection, and advanced end user and data controls for small businesses.

90% of financial fraud claims for small and medium-sized businesses originated from email.[1]	**$50k** is the median cost of Business Email Compromise (BEC) incidents.[2]	**76%** of small businesses agree that their organization lacks the skills in-house to be able to properly deal with cybersecurity issues.[3]

Security advisor in Google Workspace can help your business minimize the time, resources, and effort needed to protect your business, help prevent financial losses and brand damage, and improve business resilience and maintain customer trust.

Stay ahead of threats with personalized insights and actionable guidance, minimizing the time, resources, and effort needed to protect your business.

Make security management easier by using built-in features

Security advisor is built directly into the Workspace admin console, so you do not have to install, configure, and manage a separate security product.

Eliminate guesswork and follow insights delivered into your Inbox to resolve issues faster

Security advisor email insights share critical security information, such as users visiting malicious sites or sensitive Drive files that were shared externally.

Protect your business from web attacks that can demand payment for stolen information

Enabling Enhanced Chrome Safe Browsing with security advisor provides end users with a warning if they are trying to visit a harmful website, download a harmful file, or install a harmful extension.

Proactively protect your business against phishing attacks, malware, and other email-borne attacks to prevent financial losses and brand damage.

Protect employees and customers from falling victim to phishing scams and increase their confidence in email communications

By default, Gmail automatically blocks more than 99.9% of spam, phishing attempts, and malware from reaching users. Gmail Enhanced Safe Browsing takes an additional step to check emails for harmful content before delivering emails to recipients.

Protect against malware that impersonates your business and targets your customers with attacks

Protect against accidentally downloading malicious email attachments that steal sensitive information by blocking malware disguised as a normal email attachment. Gmail Security Sandbox isolates and analyzes email attachments in a secure, controlled environment (a sandbox) to prevent malicious code from being executed on devices.

Improve business resilience and maintain customer trust by implementing strong data sharing and device access controls.

Avoid losing customer trust and business opportunities that are consequences of accidental or malicious data leaks.

Data protection helps administrations manage and enforce data loss prevention rules. It provides a centralized dashboard where admins can deploy pre-configured data loss prevention (DLP) policies to protect sensitive information from being shared outside the organization. Data protection recommends the appropriate data protection setting to prevent unauthorized sharing.

Reduce operational disruptions that are a result of unauthorized access to Workspace data

App access evaluates the security posture of mobile devices attempting to access Workspace apps like Gmail, Drive, or Calendar. It checks for factors that might make a device risky, such as an outdated OS, missing security updates, harmful apps, and device jailbreak.

Why security advisor?

Natively integrates into Workspace

Leverages Google's AI-powered threat defenses

Provides essential account, data, and end user protection
